# Agenda

Introduction to Myocardial Revascularization

Role of Imaging in Revascularization

Key Imaging Modalities

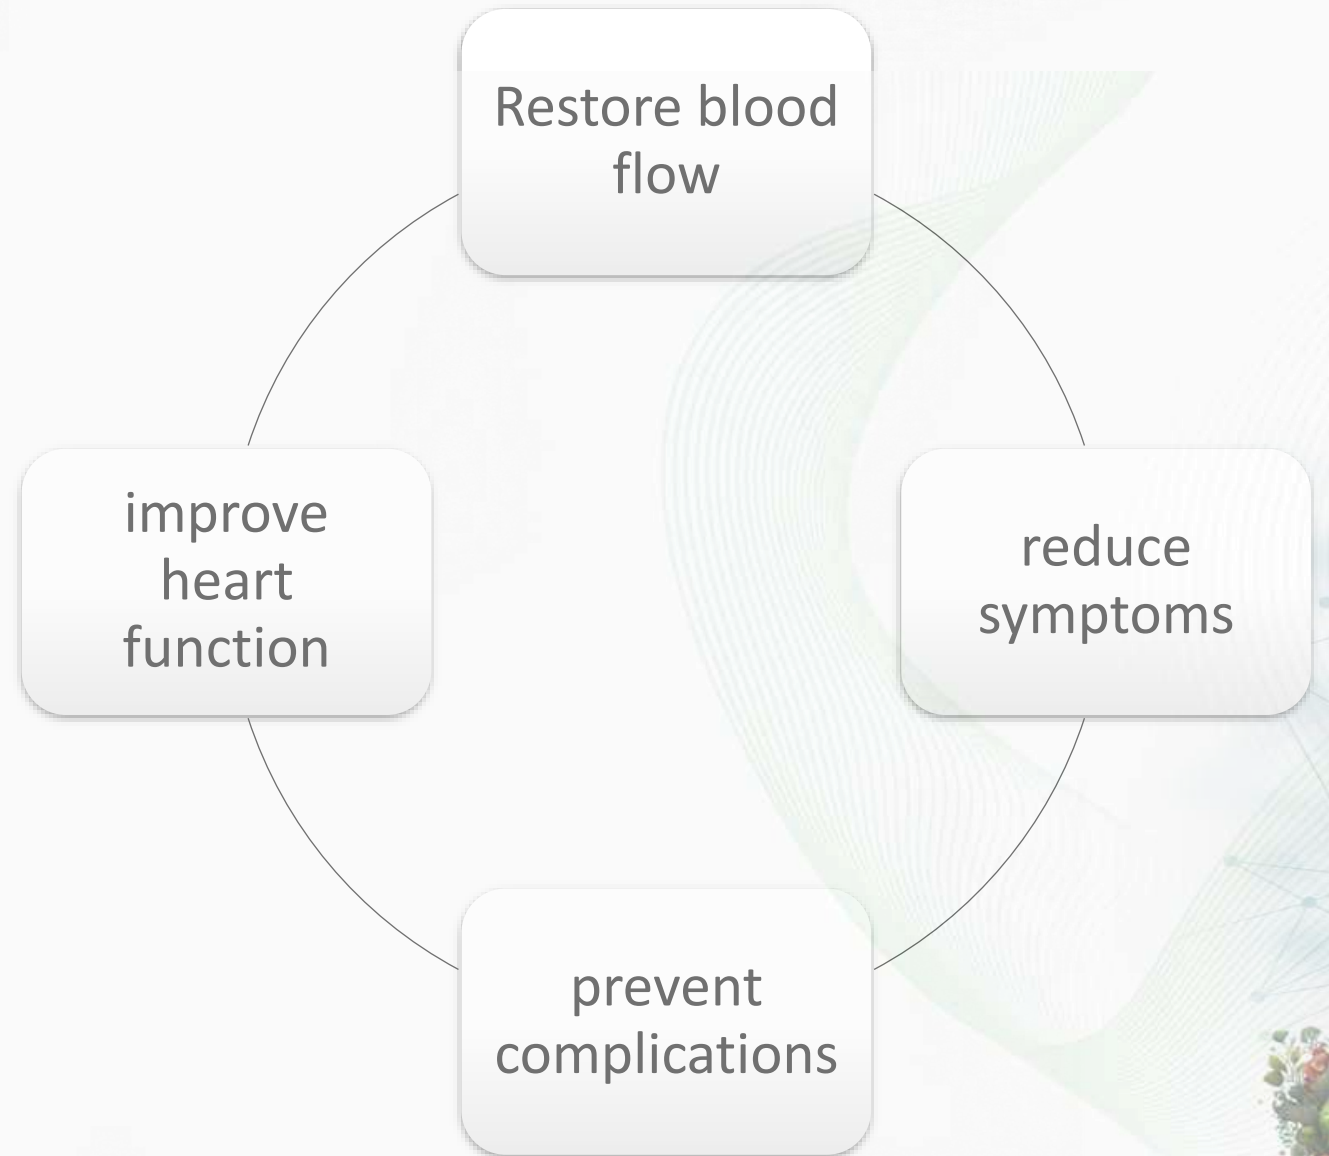

Clinical Applications

Benefits, Challenges, and Future Perspectives

# Introduction to Myocardial Revascularization

- **The aim of myocardial revascularization is to minimize ischaemia**

# Methods

## CABG

## PCI

# Role of Imaging in Revascularization

- ③ Assessing coronary artery anatomy
- ③ Identifying viable myocardium
- ③ Guiding revascularization decisions (PCI or CABG)
- ③ Evaluating post-procedure outcomes.

# Key Imaging Modalities

## Coronary Angiography

- Gold standard for visualizing coronary anatomy.
- Used during PCI and CABG planning.

## Intravascular Ultrasound (IVUS)

- Cross-sectional views of the vessel.
- Detects plaque composition and severity.

## Fractional Flow Reserve (FFR)

- Measures pressure differences to assess the functional significance of stenosis.

## Cardiac MRI & PET

- Evaluate myocardial viability and perfusion.

## CT Coronary Angiography

- Non-invasive approach for coronary assessment.

# Revasc or not revasc

ESC/EACTS GUIDELINES

## 2018 ESC/EACTS Guidelines on myocardial revascularization

The Task Force on myocardial revascularization of the European Society of Cardiology (ESC) and European Association for Cardio-Thoracic Surgery (EACTS)

Developed with the special contribution of the European Association for Percutaneous Cardiovascular Interventions (EAPCI)

### Recommendations on revascularizations in patients with chronic heart failure and systolic left ventricular dysfunction (ejection fraction $\leq 35\%$ )

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
In patients with severe LV systolic dysfunction and coronary artery disease suitable for intervention, myocardial revascularization is recommended. <sup>81,250</sup>	I	B
CABG is recommended as the first revascularization strategy choice in patients with multivessel disease and acceptable surgical risk. <sup>68,81,248,255</sup>	I	B

# What the guidelines say?

In patients with one- or two-vessel disease, PCI should be considered as an alternative to CABG when complete revascularization can be achieved.	IIa	C
In patients with three-vessel disease, PCI should be considered based on the evaluation by the Heart Team of the patient's coronary anatomy, the expected completeness of revascularization, diabetes status, and comorbidities.	IIa	C
LV aneurysmectomy during CABG should be considered in patients with NYHA class III/IV, large LV aneurysm, large thrombus formation, or if the aneurysm is the origin of arrhythmias.	IIa	C
Surgical ventricular restoration during CABG may be considered in selected patients treated in centres with expertise. <sup>252–254,256,257</sup>	IIb	B

# ESC Guidelines: for Revascularisation & for Heart Failure 2021

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
CABG should be considered as the first-choice revascularization strategy, in patients suitable for surgery, especially if they have diabetes and for those with multivessel disease. <sup>581,587,588,590</sup>	<b>IIa</b>	<b>B</b>
Coronary revascularization should be considered to relieve persistent symptoms of angina (or an angina-equivalent) in patients with HFrEF, CCS, and coronary anatomy suitable for revascularization, despite OMT including anti-anginal drugs.	<b>IIa</b>	<b>C</b>
In LVAD candidates needing coronary revascularization, CABG should be avoided, if possible.	<b>IIa</b>	<b>C</b>
Coronary revascularization may be considered to improve outcomes in patients with HFrEF, CCS, and coronary anatomy suitable for revascularization, after careful evaluation of the individual risk to benefit ratio, including coronary anatomy (i.e. proximal stenosis >90% of large vessels, stenosis of left main or proximal LAD), comorbidities, life expectancy, and patient's perspectives.	<b>IIb</b>	<b>C</b>
PCI may be considered as an alternative to CABG, based on Heart Team evaluation, considering coronary anatomy, comorbidities, and surgical risk.	<b>IIb</b>	<b>C</b>

© ESC 2021

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
In patients with severe LV systolic dysfunction and coronary artery disease suitable for intervention, myocardial revascularization is recommended [81, 250].	<b>I</b>	<b>B</b>
CABG is recommended as the first revascularization strategy, if possible, in patients with multivessel disease and acceptable surgical risk [81, 248, 255].	<b>I</b>	<b>B</b>
In patients with one- or two-vessel disease, PCI should be considered as an alternative to CABG when complete revascularization can be achieved.	<b>IIa</b>	<b>C</b>
In patients with three-vessel disease, PCI should be considered based on the evaluation by the Heart Team of the patient's coronary anatomy, the expected comorbidities	<b>IIa</b>	<b>C</b>
should be class III/obus for- origin of	<b>IIa</b>	<b>C</b>
ring CABG patients 52-254, 256, 257].	<b>IIb</b>	<b>B</b>

<b>Class I</b>	Evidence and/or general agreement that a given treatment or procedure is beneficial, useful, effective.	<b>Is recommended or is indicated</b>
<b>Class II</b>	Conflicting evidence and/or a divergence of opinion about the usefulness/efficacy of the given treatment or procedure.	
<b>Class IIa</b>	Weight of evidence/opinion is in favour of usefulness/efficacy.	<b>Should be considered</b>
<b>Class IIb</b>	Usefulness/efficacy is less well established by evidence/opinion.	<b>May be considered</b>
<b>Class III</b>	Evidence or general agreement that the given treatment or procedure is not useful/effective, and in some cases may be harmful.	<b>Is not recommended</b>

# STICH – 2011

#### No. at Risk

Medical therapy	602	532	487	435	312	154	80
CABG	610	532	486	459	340	174	91

**Figure 1.** Kaplan–Meier Curves for the Probability of Death from Any Cause. CABG denotes coronary-artery bypass grafting.

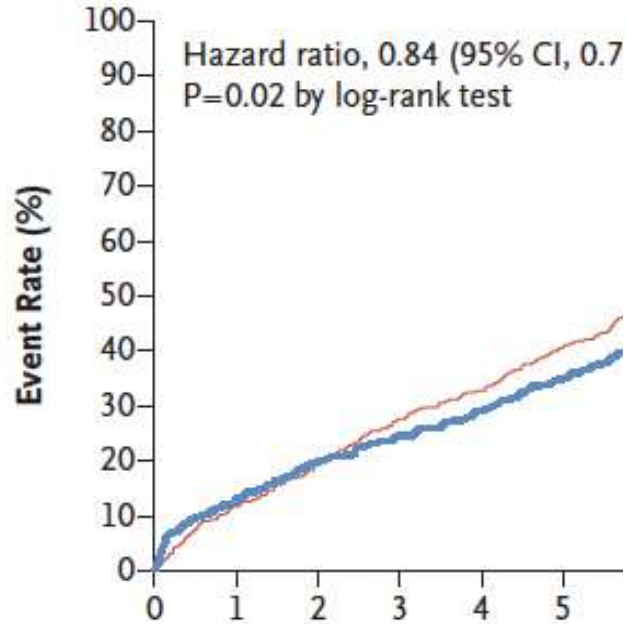

# •STICHES trial

# Improvement of Prognosis - STICHES

**A Death from Any Cause (Primary Outcome)**

**B Death from Cardiovascular Causes**

**C Death from Any Cause or Cardiovascular Hospitalization**

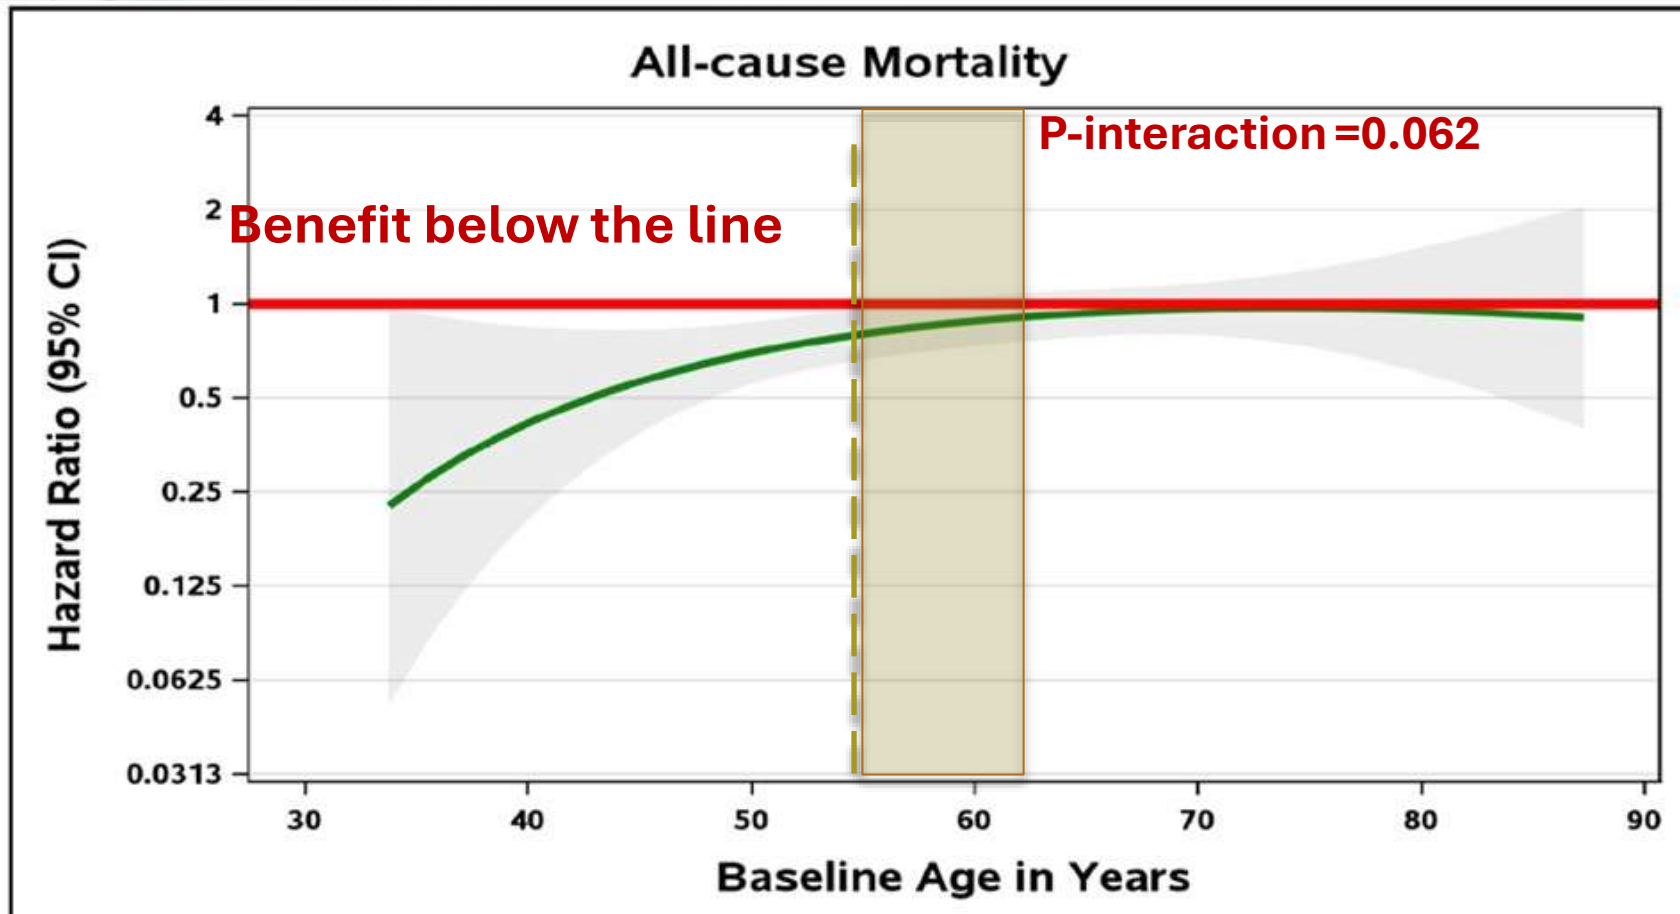

No. at Risk	Years since Randomization											Years since Randomization											
	0	1	2	3	4	5	6	7	8	9	10	4	5	6	7	8	9	10	11				
Medical therapy	602	532	487	435	404	357	315	274	248	164	82	602	532	487	435	404	357	315	274	248	164	82	37
CABG	610	532	487	460	432	392	356	312	286	205	103	610	532	487	460	432	392	356	312	286	205	103	42

**You must live a long time to benefit from CABG.  
Patients with HFrEF aged >55 years might not.**

# STICH: Myocardial Viability Sub-study

## Kaplan–Meier Analysis of the Probability of Death, According to Myocardial Viability Status

Patients with viable myocardium had lower overall rates of death than those without viable myocardium

However, after adjustment for other significant baseline prognostic variables in a multivariable model, the prespecified viability status was no longer significantly associated with the rate of death (P=0.21)

# Dobumatin Stress-Echo / SPECT

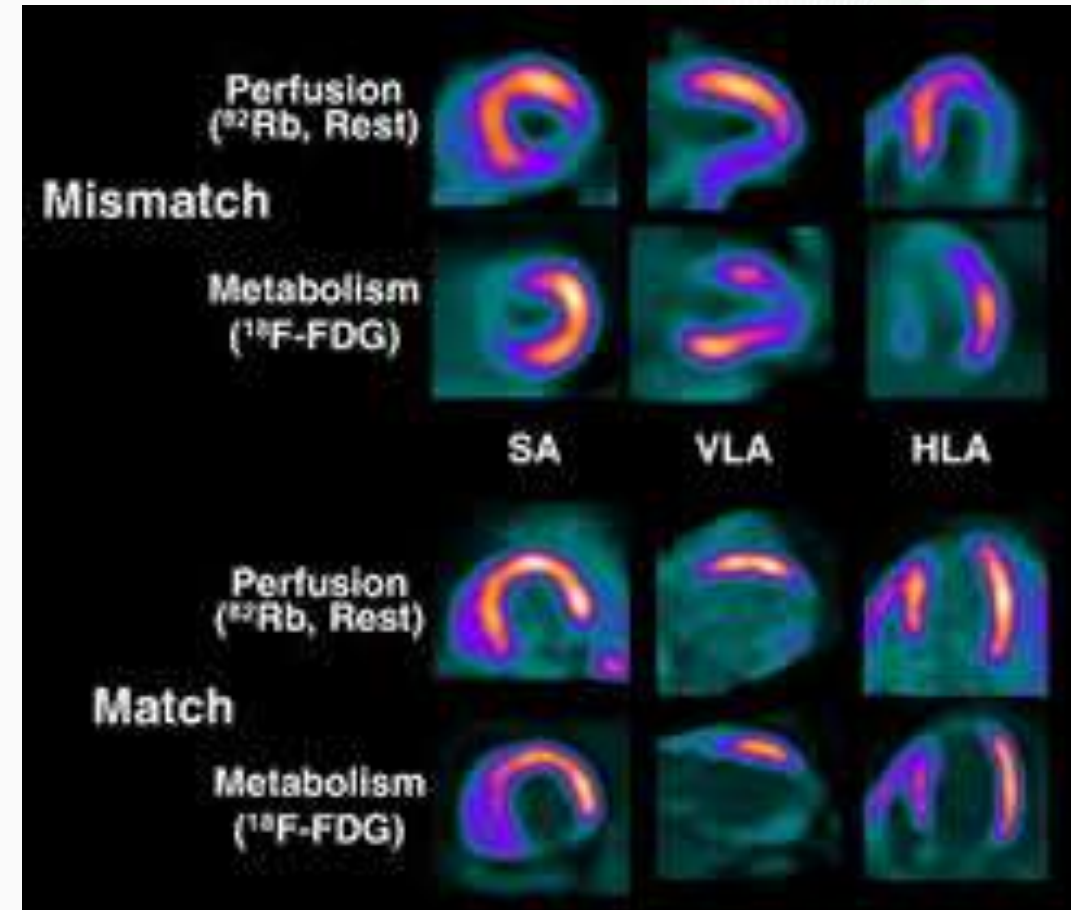

# CMR

# PET

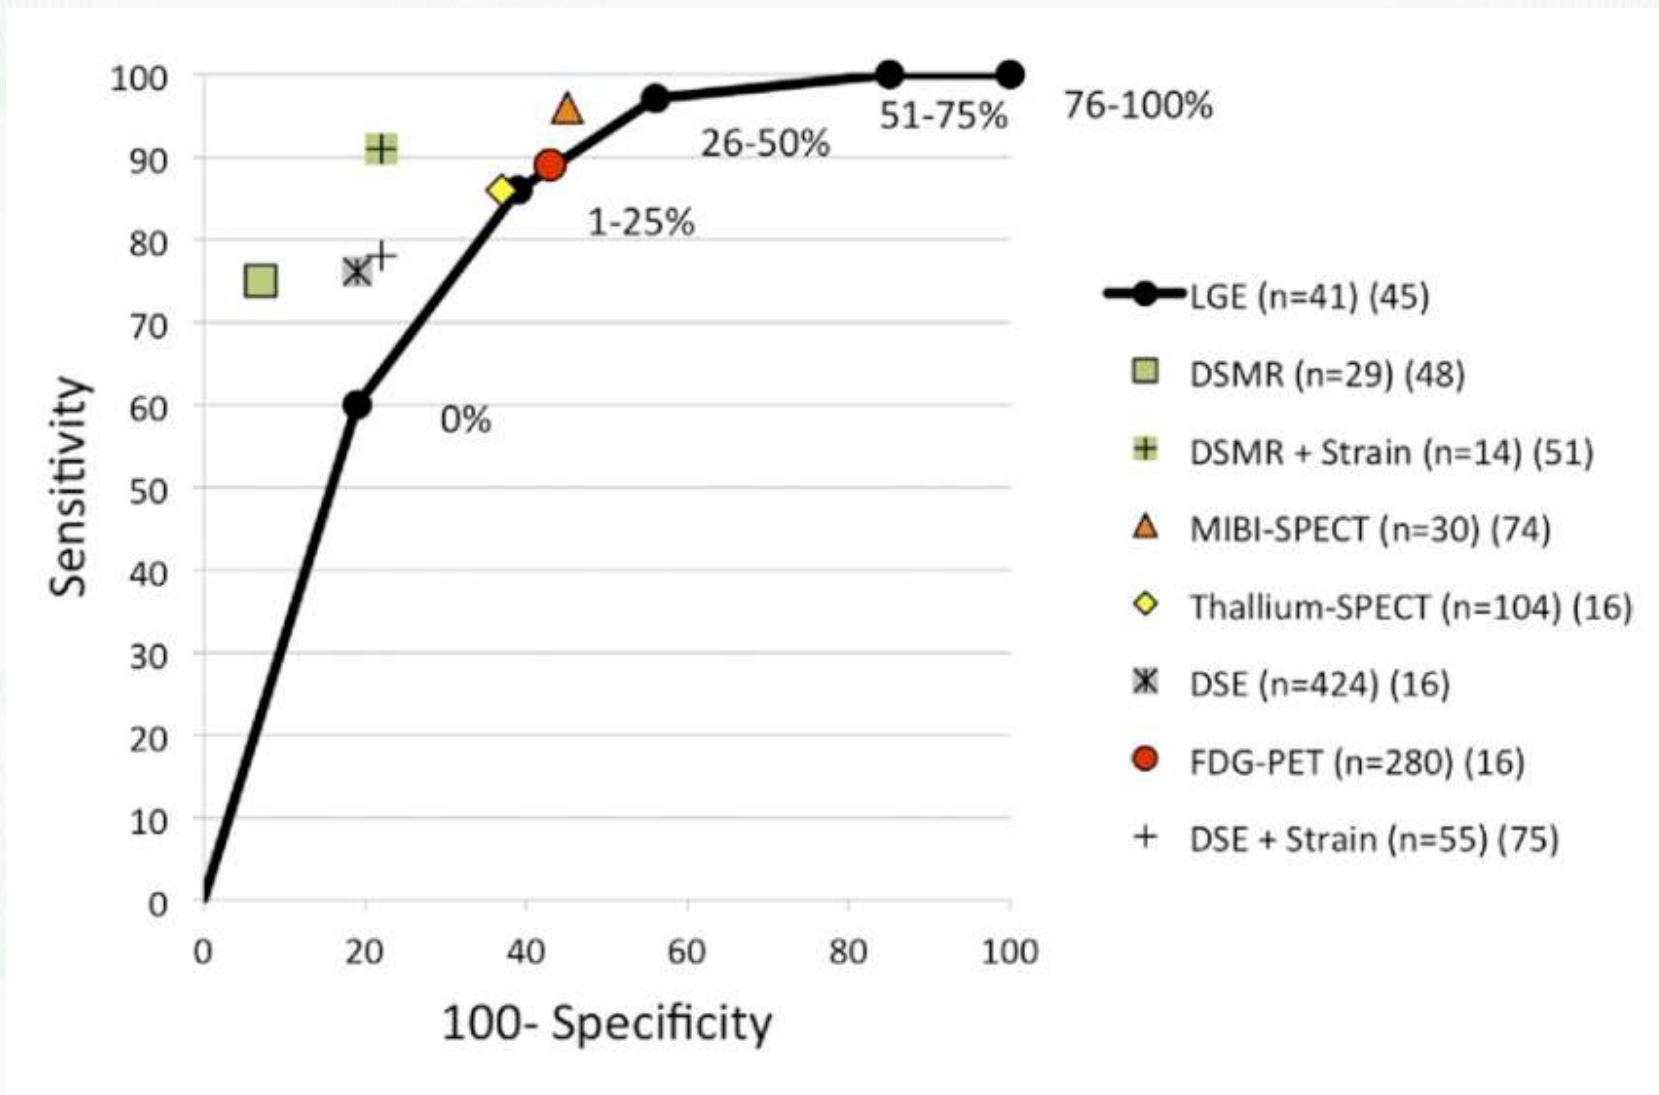

# Comparison for Myocardial Viability

<b>Modality</b>	<b>Sensitivity</b>	<b>Specificity</b>	<b>Key Strength</b>	<b>Main Limitation</b>
DSE	Moderate	High	Contractile reserve assessment	Operator dependency, poor in bad windows
SPECT	High	Moderate	Perfusion and viability, widely available	Limited resolution, radiation
PET	Very High	Very High	Gold standard for metabolic viability	Cost, availability
Cardiac MRI (LGE)	Very High	Very High	Accurate scar quantification	Cost, contrast contraindications
CT Perfusion	Moderate	Moderate	Combined coronary and perfusion data	Emerging, radiation exposure

# Diagnostic significance of different methods in the assessment of dysfunctional myocardium

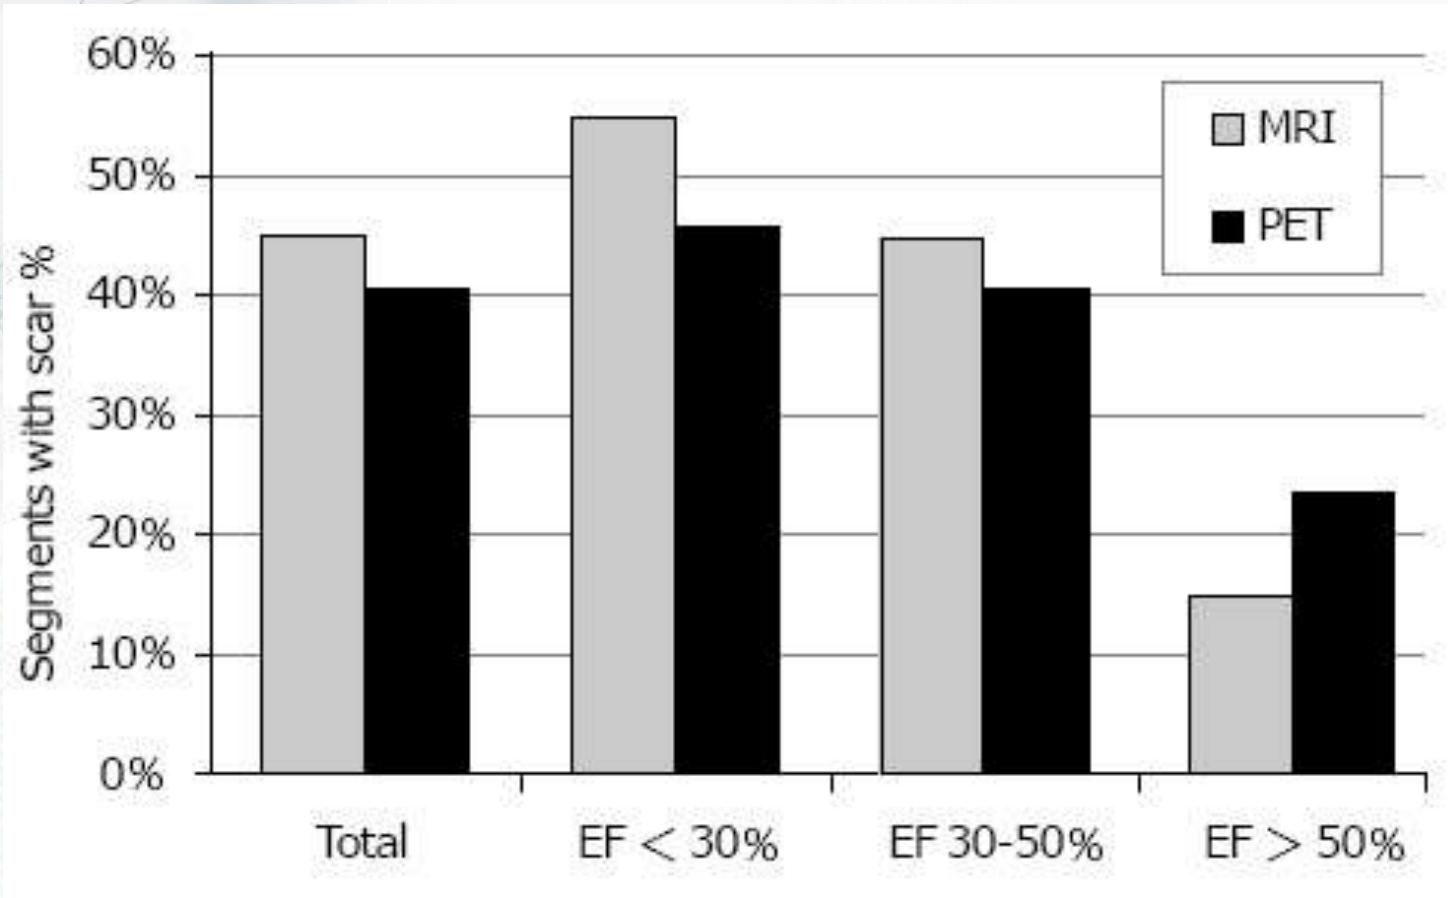

**FIGURE 3** Range of Sensitivity, Specificity, PPV, and NPV of Currently Available Viability Testing Modalities

<sup>18</sup>F-fluorodeoxyglucose positron emission tomography (FDG-PET) imaging offers the greatest sensitivity, with comparable specificity to other

# PET vs MRI

[Accuracy of myocardial viability imaging by cardiac MRI and PET depending on left ventricular function.](#)

## SEGMENTAL MYOCARDIAL VIABILITY

### DELAYED MYOCARDIAL ENHANCEMENT

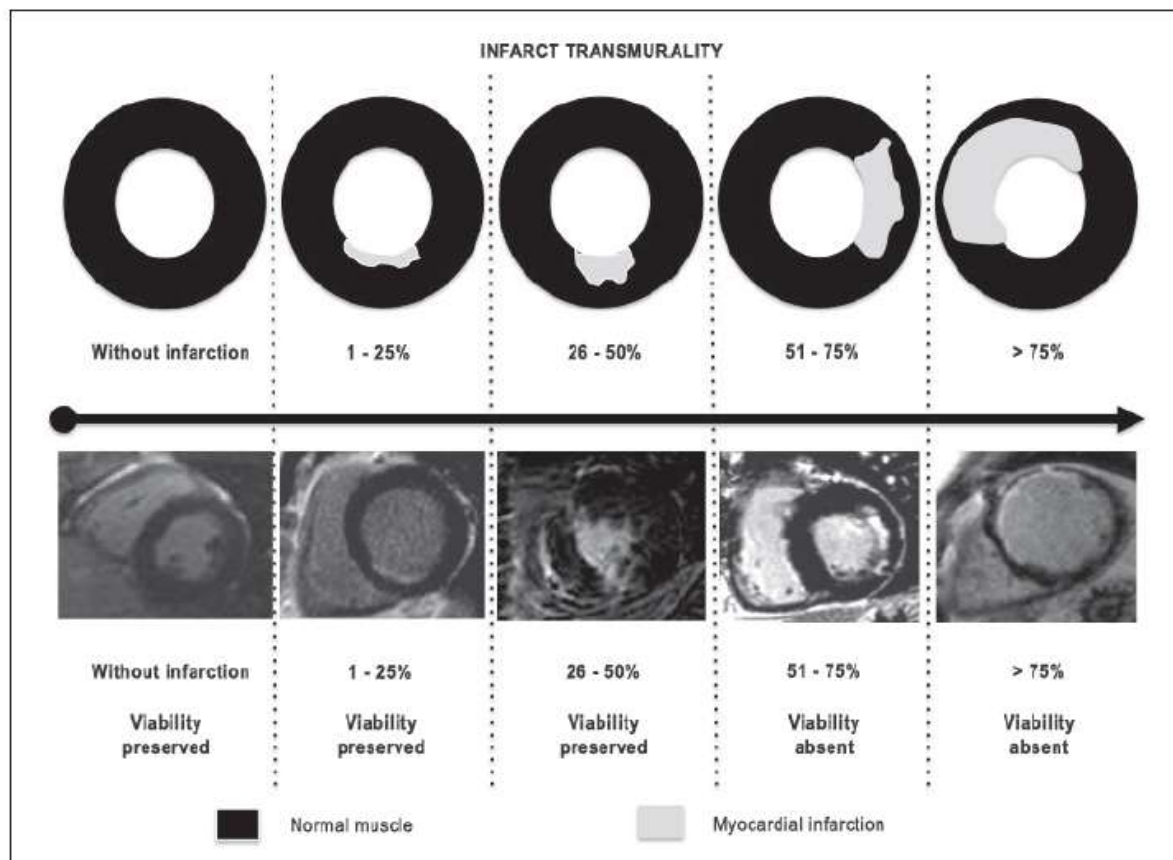

- Absent
- < 25% of the segment area
- < 50% of the segment area
- > 50% of the segment area
- > 75% of the segment area

### POTENTIAL OF CONTRACTILE RECOVERY

- Segmental viability present
- Segmental viability absent

### INFARCT TRANSMURALITY

# Revasc for Ischemic ventricular dysfunction (REVIVED trial)

**Primary  
Endpoint**

Death from Any Cause  
or Hospitalization for  
Heart Failure

129 Events (37.2%)

134 Events (38.0%)

**Hazard Ratio 0.99**  
**95% CI 0.78 - 1.27**  
**p=0.96**

# REVIVED : RCT on PCI versus OMT in CHF

## Components of primary endpoint

Number at risk

	0	1	2	3	4	5	6	7	8
PCI	347	317	287	198	143	87	37	14	3
OMT	353	315	291	204	155	93	36	11	2

Number at risk

	0	1	2	3	4	5	6	7	8
PCI	347	295	262	179	130	80	32	14	3
OMT	353	299	276	191	142	82	33	10	1

ed comparison of the strategy of PCI plus op- compared with strat- therapy alone, among ventricular systolic dys- ary artery disease, and eardium. The incidence e or hospitalization for y outcome) did not dif- n the trial groups. An PCI was observed with but the between-group r time owing to the pro- scores in the optimal- ardiac function appeared ups over the course of e was not affected by

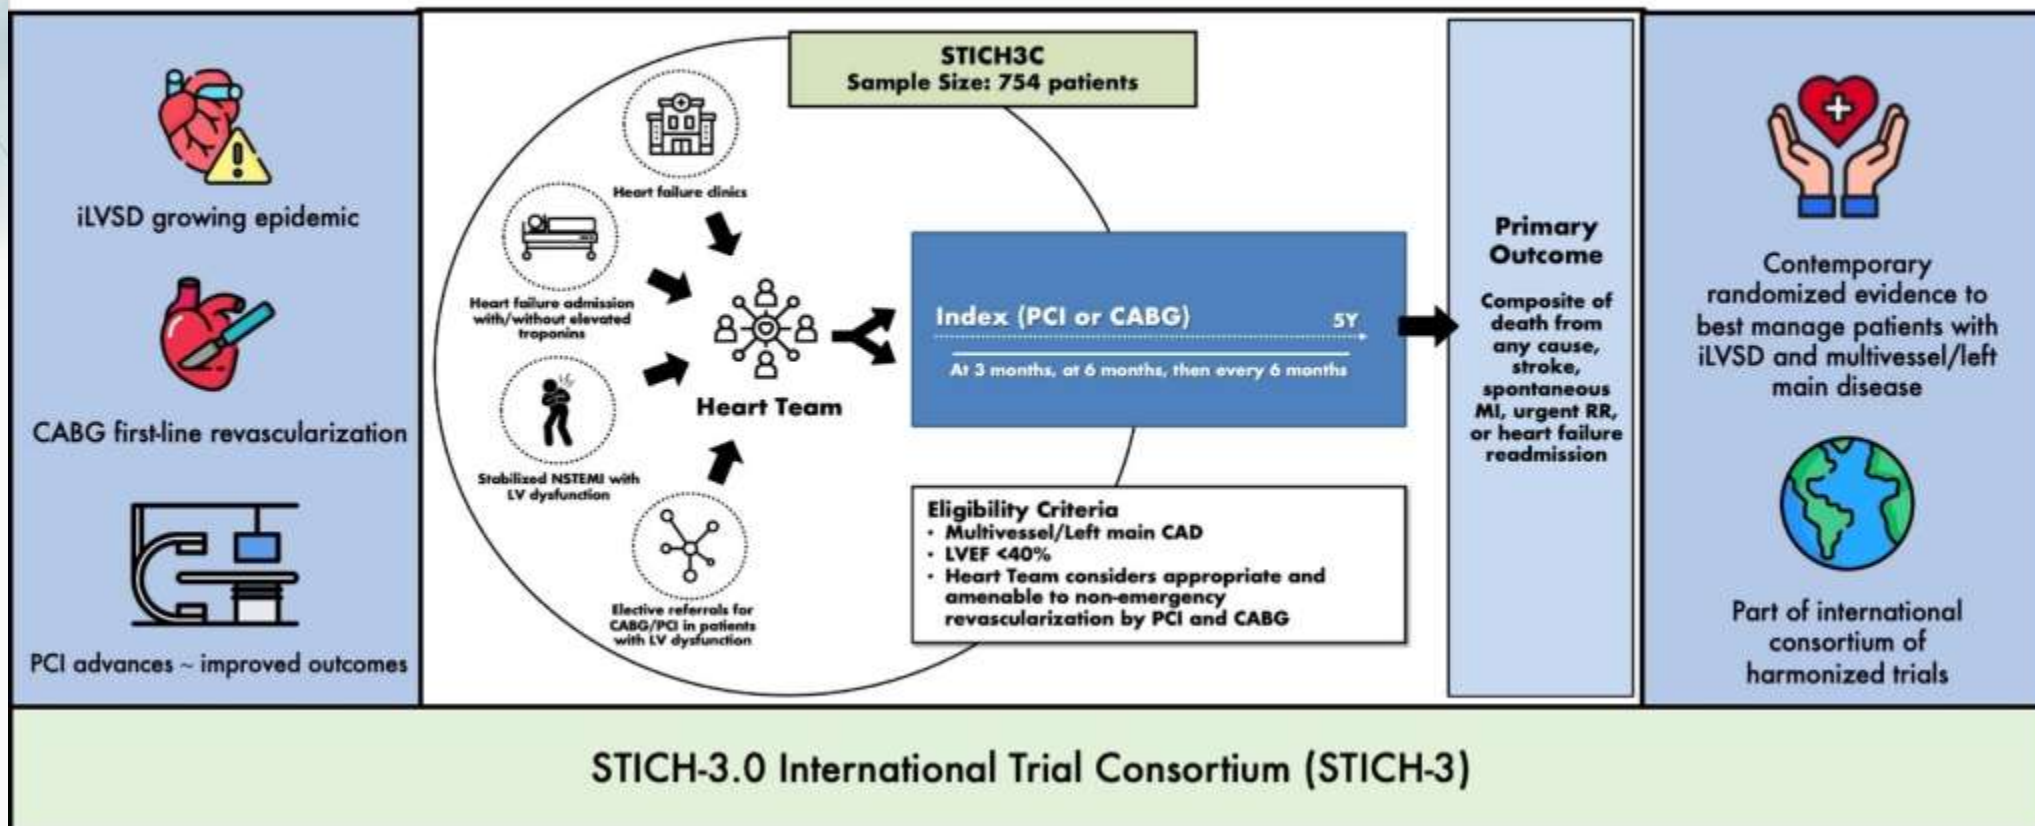

function that was incremental to the improve- ment with optimal medical therapy alone. These findings challenge the paradigm of myocardial hibernation, which is classically defined accord- ing to improvement in left ventricular volumes and function after revascularization. Our obser- vations mirror those in the STICH trial, in which revascularization by CABG did not affect left ventricular function, a finding that was consis- tent across the whole trial cohort, including the subgroup who underwent **discretionary** viability testing.<sup>16</sup> We have not yet determined the con- cordance between the coronary arteries revascu- larized by PCI and the viable myocardial seg- ments; hence, we cannot determine whether viability tests predict changes in segmental contractile function after medical therapy or re- vascularization or whether such changes are linked to clinical outcomes.<sup>17</sup>

# Upcoming RCTs – STICH-3

## The Canadian CABG or PCI in Patients with Ischemic Cardiomyopathy Trial (STICH3C): Rationale and Study Protocol

Fremes et al. *Circulation: Cardiovascular Interventions*. 2023.

# Clinical Applications

- **Pre-Procedure Planning**
  - Selecting the revascularization strategy (PCI vs CABG).
  - Identifying areas of ischemia or myocardial viability.
- **During Procedure**
  - Guiding stent placement (OCT/IVUS).
  - Assessing results of angioplasty or bypass.
- **Post-Procedure**
  - Monitoring restenosis or complications.

# Benefits and Limitations of Imaging-Guided Revascularization

- Precision in diagnosis and treatment.
- Improved procedural success rates.
- Reduced complications and restenosis.
- Enhanced patient outcomes and quality of life.
- Cost of advanced imaging modalities.
- Need for specialized training.
- Limited accessibility in some regions.
- Risk of complications with invasive imaging techniques.

# Future Perspectives

- ✓ Integration of AI in imaging analysis.
- ✓ Emerging modalities (e.g., hybrid imaging).
- ✓ Personalized treatment plans using multimodality imaging.

# Conclusions

- **No good evidence that revascularization (~~anatomical~~) of chronic 'stable' coronary artery disease improves outcome whether or not**
  - **LVEF is Reduced**
  - **Myocardial viability / ischaemia**
  - **Diagnosis of Heart Failure**
- **Most patients with heart failure**
  - **Are aged >70 years**
  - **Patients with heart failure are at high risk – bad things happen to them**

## Future

**Imaging-guided Functional revascularization**
